

AN: PAT 1998-313270
 TI: Data connection routing procedure for telecommunications network
 provides optimum alternative connection path when direct connection
 path is overloaded via quantitative evaluation system
 PN: DE19639185-C1
 PD: 18.06.1998
 AB: The routing procedure involves responding to a detected overload
 in the data transmission bundle between 2 directly connected
 nodes (K1,K2) of the telecommunications network A alternative
 connection route via at least two successive transmission paths
 is determined, dependent on the loading. Pref. the loading of
 each transmission path is determined using an exponential proximity
 function.; Uses quantitative evaluation for selection of optimum
 alternative connection path.
